

Christopher's Product Testing Guide

Use the app as a customer, explore every feature, and report anything that does not work or make sense.

Your job in one sentence

Use every part of the Food Truck Event Profit Calculator, click everything you can, and write down anything that does not work, does not make sense, or is harder than it should be.

Your testing role

- Work through every part of the app and use the test data provided.
- Pay attention to what works, what fails, and what feels unclear or difficult.
- Record what happened and take screenshots whenever they would help.
- Focus on observing and reporting during this testing pass.
- Deidra will review the report and coordinate any corrections.

What Deidra needs from you

- [] Tell her what worked normally.
- [] Tell her what did not work.
- [] Tell her what was confusing, unclear, awkward, ugly, crowded, or difficult to find.
- [] Tell her when a button label or instruction did not make sense.
- [] Tell her when the app gave a number or recommendation that did not match the expected result in the Test Data guide.
- [] Tell her anything that made you hesitate or wonder what you were supposed to do next.

How to test the app

- 1 Start on the Welcome screen and move through the app in the order shown in this guide.
- 2 Use only the information in the separate Test Data PDF. Do not enter real customer or personal information.
- 3 On every screen, click every visible button, link, menu, arrow, tab, checkbox, radio choice, dropdown choice, and help item at least once.
- 4 Read every title, label, instruction, warning, error, and success message. Ask yourself whether a first-time user would understand it.
- 5 Try the normal path first. Then try a few mistakes: leave required information blank, type letters in a number box, enter a negative number, or click Back and Cancel.
- 6 Refresh or close and reopen the app after important saves. Make sure the information is still there.
- 7 When something seems wrong, take a screenshot and make a quick note. Keep testing unless the problem prevents you from continuing.

How to record findings

Describe each problem in your own words. Include where you were, what you clicked or entered, what you expected, and what happened. Deidra will use your report to plan the corrections.

What counts as a problem?

Type of problem	What it means
Broken	A button does nothing, a page will not open, the app crashes, or information disappears.
Wrong	The app saves the wrong information, shows the wrong total, or gives the wrong recommendation.
Confusing	You cannot tell what a label means, what to enter, or what will happen when you click.
Hard to use	A task takes too many steps, an important action is hard to find, or the page feels crowded.

Type of problem	What it means
Looks bad	Text overlaps, gets cut off, is too small, is misaligned, or the charcoal design looks inconsistent.
Unexpected	The app behaves differently from what a normal customer would reasonably expect.

Testing order

Work through the sections below in order. The Test Data PDF tells you exactly what information to enter.

1. Welcome and first setup

This is what a brand-new customer sees the first time the app opens.

- [] Read the entire Welcome screen. Does it explain what the app does?
- [] Click "See what you will set up" and make sure it goes to the right place.
- [] Click "I will do this later" and see whether the limited Dashboard makes sense.
- [] Return and click "Set up business defaults."
- [] Use Back, Continue, Save and finish later, the step buttons, and every Edit link on the review page.
- [] Open every dropdown and choose every available option at least once.
- [] Use Add and Remove for employee labor rows.
- [] Switch between the two profit target choices.
- [] Save the defaults, close the app, reopen it, and make sure the saved information is still there.

Pay special attention to:

The app should clearly show which information is required, which is optional, and which choices reveal extra boxes.

2. Dashboard

The Dashboard should make the customer understand what to do next.

- [] Click every visible Dashboard button and link.
- [] Check the Dashboard before any events exist and again after several events exist.
- [] Make sure the event and scenario counts are correct.
- [] Open a recent event from the Dashboard.
- [] Use New Analysis and View All.

Pay special attention to:

A customer should not have to hunt for the next step.

3. Create a new event

This is the longest and most important workflow. Take your time.

- [] Use each test event in the data guide. Start with Harbor Lights Market.
- [] Move through every step using Back and Continue.
- [] Use every Edit link on the final review screen.
- [] Test each weather choice and each protection choice.
- [] Switch between calculated sales and custom sales.
- [] Test all three food-cost methods and click "Use this method."
- [] Add and remove employee rows.
- [] Add and remove miscellaneous cost rows.
- [] Use Save as draft, leave the screen, and return to the draft.
- [] Use Analyze Event and make sure only one event is created, even if you click once more by accident.
- [] Try a few wrong entries from the "Wrong data to try" page in the Test Data guide.

Pay special attention to:

The app should keep correct information after one field has an error. It should never silently save incomplete or wrong information.

4. Event Analysis

This screen should help the customer decide whether the event is worth accepting.

- [] Compare the totals and recommendation with the expected result in the data guide.
- [] Open every expandable explanation or calculation detail.
- [] Edit an assumption and watch the totals update.
- [] Use Reset Changes and make sure the original values return.
- [] Use Save Changes, Cancel, Save as new Scenario, and Overwrite.
- [] Create a duplicate Scenario.
- [] Rename a Scenario.
- [] Switch between Scenarios.
- [] Try to leave with unsaved changes and check whether the warning makes sense.
- [] Use every link back to Saved Events, New Analysis, Edit Inputs, and Comparison.

Pay special attention to:

The recommendation, profit, margin, costs, warnings, and break-even numbers should all agree with one another.

5. Saved Events and Scenario Comparison

This is where customers find, organize, compare, rename, and delete saved work.

- [] Search for an event by its name, location, and Scenario name.
- [] Try every sort option and every status filter.
- [] Open Events and Scenarios from the list.
- [] Use Manage, Rename, Compare, and every More menu.
- [] Create enough Scenarios to compare two, three, and four at once.
- [] Use every comparison control, including the baseline choice and "Show differences only."
- [] Open a Scenario from the comparison screen and return.
- [] Delete one disposable Scenario and make sure the other Scenarios remain.
- [] Delete one disposable Event and make sure unrelated Events and Defaults remain.
- [] Cancel out of every rename and delete window at least once before confirming it.

Pay special attention to:

Destructive actions should clearly explain what will be deleted and should not happen by accident.

6. Profile, notifications, and Help Center

These smaller areas still need to feel complete and trustworthy.

- [] Open the profile menu and save a test name and test email.
- [] Edit the profile and make sure the change remains after reopening the app.
- [] Open notifications, mark one as read, mark all as read, dismiss one, and follow any action link.
- [] Open every Help Center section and every troubleshooting question.
- [] Click Copy support information and paste it into Notepad.
- [] Make sure the copied support information does not include event names, locations, financial figures, or the test profile email.
- [] Test the support email link if the computer is configured to open email.

Pay special attention to:

Help text must match the actual names of screens and buttons in the app.

7. Data Safety

Use only test data here. Make a backup before testing anything that deletes information.

- [] Download the sample format.
- [] Download a backup and keep the file somewhere easy to find.
- [] Change or delete some test data, then restore the backup and make sure the old data returns.
- [] Cancel the Import, Delete Events, Reset Defaults, and Clear Everything windows before testing the real action.
- [] Delete Events and make sure Business Defaults remain.
- [] Reset Defaults and make sure saved Events remain.
- [] Use Clear Everything only after a backup exists. Make sure all app data is actually cleared and the Welcome screen returns.
- [] Restore the backup again so testing can continue.

Pay special attention to:

The wording must make the full effect of each destructive action completely clear.

8. Window, keyboard, and restart checks

A normal customer will resize, close, reopen, and sometimes use the keyboard.

- [] Make the app window wide, narrow, maximized, and small enough to force the compact layout.
- [] Check that nothing overlaps, disappears, or becomes impossible to click.
- [] Press Tab several times on each main screen. Make sure you can see where the keyboard focus is.
- [] Use Enter or Space on buttons and choices where it makes sense.
- [] Press Escape to close menus and dialogs.
- [] Close and reopen the app several times during testing.
- [] Try opening the app a second time while it is already open and report what happens.

Pay special attention to:

Use only the controls provided inside the app. Do not edit application files or intentionally damage the app database.

How to write your report

Use any format that works well: a Word document, Google Doc, email, notes app, or numbered list. You do not need to use a special template.

For each problem, try to include five things

1) Where you were. 2) What you clicked or entered. 3) What you expected. 4) What actually happened. 5) A screenshot, when possible.

Example

Saved Events - Rename Event

I clicked Manage, erased the event name, and clicked Rename.

I expected the app to tell me a name is required and keep the rename box open.

Instead, the window closed and the event disappeared from the list until I refreshed.

This happened twice. Screenshot attached.

Before you say testing is finished

- [] Every normal screen was opened.
- [] Every visible button, link, menu, choice, and dialog was used.
- [] All five test business profiles and all five test events were entered.
- [] Expected totals were checked.
- [] Saving, reopening, editing, renaming, comparing, backing up, restoring, and deleting were tested.
- [] Text, labels, warnings, and Help content were reviewed for clarity.
- [] The app was tested at more than one window size.
- [] Every problem and concern was included in the report.

The most useful thing you can give Deidra

Be honest about your experience. If you eventually figured something out but it confused you first, report it. The app is supposed to make sense without Deidra standing beside the customer.
